

General Information

Specialized Engine Exhaust Silencers

EN Series Silencers

Multi-Chamber Silencers

For the majority of engines and operating conditions, multi-chamber type silencers provide maximum noise attenuation within acceptable back pressure limits. Most naturally aspirated and supercharged engines need this type of silencer. Many turbocharged engines are best silenced with this design also. Factors which influence the choice of silencer design are explained on the following page.

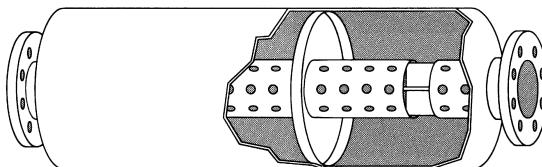

Multi-chamber exhaust silencers for most reciprocating engines.

ET Series Silencers

Straight-Through Silencers

Some engines require very low exhaust system back pressures for maximum performance. Many turbocharged engines and some naturally aspirated engines fall into this category. For these engines, straight-through, reactive silencers are available to provide adequate silencing while imposing negligible restriction on exhaust gas flow.

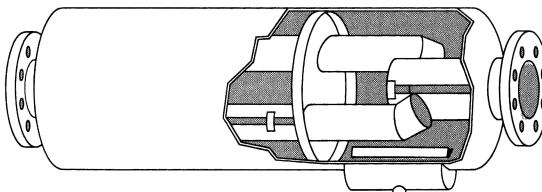

Straight-through exhaust silencers for engines which demand very low back pressures.

ES Series Silencers

Spark Arresting Silencers

Operating locations exist where fire hazards and safety codes require removal of sparks from exhaust gases. Universal Silencer's spark arrestor silencers are engineered to perform the dual function of spark arrestment and silencing for all internal combustion engines.

Spark arresting exhaust silencers for engines operating in high potential fire areas.

Sizing Information

Engine Exhaust Silencers

Universal Silencer's engine exhaust silencers are high quality, fully welded, reactive silencers designed to reduce exhaust noise on all types of internal combustion engines. Each engine and each operating location requires a unique

combination of silencer properties. For this reason many different silencer models are cataloged to cover most silencing problems. In cases where standard silencers will not meet a particular spec, these custom silencers will satisfy the application need.

Choosing the correct exhaust silencer for a given engine is an important although not difficult task. First of all, a degree of silencing is chosen that will satisfy the noise requirements unique to each engine and location. Secondly, the silencer size is selected to accommodate the specified volume of exhaust flow without imposing excessive back pressure.

Selection of Silencer Type (Grade)

Each silencer group described on pages 7.3–7.6 has a number of a series with different noise attenuation characteristics.

The series letter designation (e.g., EN2) indicates in relative terms the degree of noise attenuation; the higher the number, the greater the attenuation.

- 2 "Industrial" or "Commercial" grade
- 3 "Residential" grade
- 4 "Critical" grade
- 5 "Hospital" grade

The attenuation curves next to the tables on each page indicate the attenuation in dB by octave bands.

These curves are based upon "typical" applications. They will not necessarily define the precise insertion loss for any specific application since the insertion loss achieved may be influenced substantially by many factors, including engine size, type, speed, and unsilenced noise levels and frequency distribution.

Selection of Silencer Size

The open flow area within the silencer should be large enough to accommodate the maximum possible exhaust flow without exceeding the engine manufacturer's maximum allowable back pressure. Improperly sized silencers may cause loss of power or damage to the engine.

Data required:

- engine exhaust flow (CFM)
- exhaust temperature (°F)
- maximum back pressure (inches of water)

The following formulas enable the correct silencer size to be quickly determined.

1 Calculate gas velocity.

$$V = 4005 \sqrt{\frac{\Delta P}{c \left(\frac{530}{T + 460} \right)}}$$

V = gas velocity

ΔP = back pressure, inches of water

c = silencer pressure drop coefficient
(Table 1)

T = exhaust gas temperature, °F

Note: Velocity should not exceed 15,000 ft/min regardless of the allowable back pressure.

2 Calculate required flow area.

$$\text{Flow Area Required (ft}^2\text{)} = \frac{\text{CFM}}{V}$$

3 From Table 2, select the silencer size which has a flow area equal to or greater than that calculated, the actual back pressure can be calculated as follows:

$$V_{\text{actual}} = \frac{\text{CFM}}{\text{silencer flow area}}$$

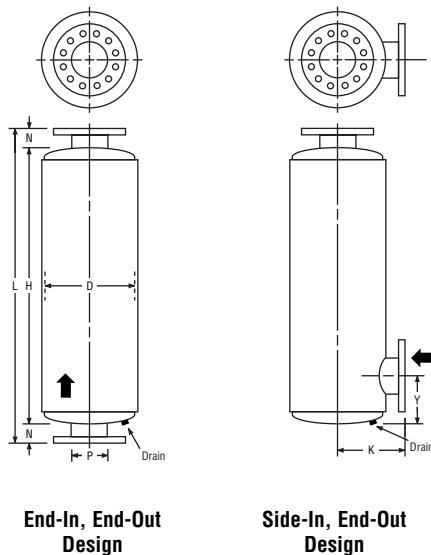

$$\Delta P = c \left(\frac{V_{\text{actual}}}{4005} \right)^2 \left(\frac{530}{T + 460} \right)$$

EN Series

Multi-Chamber Silencers

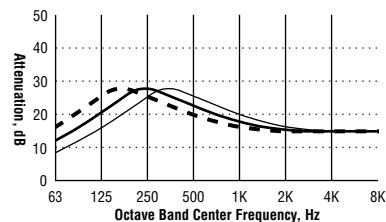

EN2, EN3, and EN4 Series Engine Exhaust Silencers are heavy-duty, fully welded units constructed of carbon steel sheet and plate. Each silencer is equipped with flanged connections drilled to match 125/150 lb ANSI specifications. Exterior surfaces receive a coat of heat resistant paint.

For EN5 Series, 1"-3½" are sizes equipped with standard male pipe thread connections. Sizes 4" and larger have flanged connections drilled to match 125/150 lb ANSI specifications.

The addition of "Y" in the model designation indicates a side inlet. Both configurations are fundamentally alike and performance is identical.

ET2, ET4 Series

ET Series
Straight-Through Silencers

ET2 and ET4 Series Engine Exhaust Silencers are heavy-duty, fully welded units constructed of carbon steel sheet and plate. Each silencer is equipped with flanged connections drilled to match 125/150 lb ANSI specifications. Exterior surfaces receive a coat of heat resistant paint.

Due to low back pressure requirements, no side inlet configuration is cataloged. In some special cases side inlets may be designed on application.

Flex Connectors

P (Size)	L (Nominal)	Weight
1	18	4
1½	18	6
2	18	7
2½	18	9
3	18	10
3½	18	12
4	18	14
5	18	17
6	18	24
8	18	36
10	18	62
12	18	69
14	18	90
16	18	110
18	18	130

Flex Connectors are recommended for engine exhaust applications to compensate for thermal expansion and vibration (but not misalignment). Flexible material is type 321 stainless steel, suitable for temperatures to 1200°F. Flanges and pipe fittings are mild steel. Sizes 1"-3½" are standard with male NPT, larger sizes are equipped with flanges drilled to 125/150 lb ANSI.

Companion Flange Set

Pipe Size	Weight
4	7
5	10
6	13
8	16
10	30
12	35
14	45
16	55
18	65
20	90
22	105
24	115
26	130
28	150
30	160

Each Companion Flange Set includes one mild steel welding flange drilled to match 125/150 lb ANSI, one gasket and one set of bolts and nuts. Cast iron threaded flanges and stainless steel flanges are available and will be quoted on request. Single and double reducing flanges are also available.

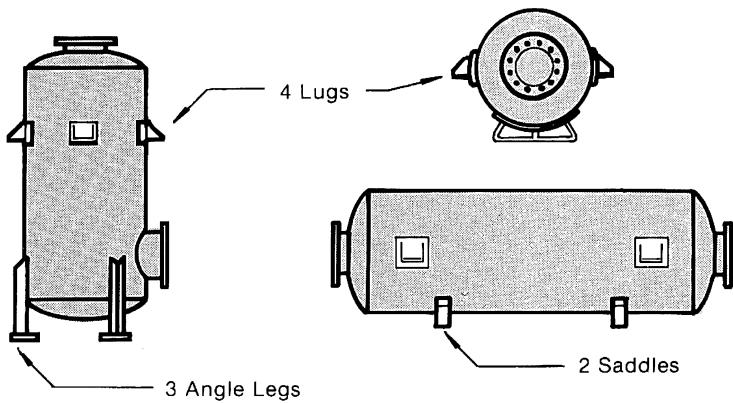

Raincaps

Part Number	P (Fits Pipe Size)	Weight
80-1061	1	½
80-1062	1½	½
80-1063	2	1
80-1064	2½	1
80-1065	3	1
80-1066	3½	1½
80-1067	4	2
80-1068	5	2
80-1034	6	5½
80-1035	8	8
80-1036	10	11
80-1037	12	14
80-1038	14	22
80-1039	16	26
80-1040	18	30
80-1041	20	34
80-1042	22	36

Raincaps prevent rain, snow, and dust from entering the exhaust system. Non-corrosive bushings insure positive opening. All sizes are standard in mild steel with high temperature paint. Sizes 8"-22" are also available in stainless steel—quoted by request and equipped with adjustable counterweights.

Engine Exhaust Silencers

Mounting Attachments

Mounting Attachments are welded in place on the silencer shell to facilitate installation. Standard and variable dimensions are available.

Inspection Openings

Part	Inspection Opening Size (Oval)	Weight
80-1019	3 x 4	4
80-1020	4 x 6	6
80-1021	6 x 8	12
80-1025	8 x 10	20

Inspection Openings have removable covers to provide access to silencer internals for inspection or cleaning. Usually one opening per silencer chamber is recommended.

Explosion Relief Cover

Part	P-Relief Cover Size	Weight
80-1059	12	80
80-1060	16	110
80-1053	20	140

Explosion Relief Covers are designed to open at 5 PSI to protect the silencer shell against rupture in case of backfire or explosion of residual gases within exhaust system. One unit in first chamber of silencer is adequate.
